## 2.1 buckets package

### 2.1.1 Submodules

### 2.1.2 buckets.bin\_data module

`buckets.bin_data.bin_n(x, y, n)`

Bins the input data  $x$  into ‘ $n$ ’ bins and calculates the mean of  $y$  in those bins. Each bin contains the same number of elements.

#### Parameters

- $x$  (*array-like*) –  $x$  value to bin  $y$  value data by.
- $y$  (*array-like*) –  $y$  value to average over each  $x$  bin.
- $n$  (*int*) – Number of elements to include in each bin.

#### Returns

- $X$  (*np.array*) – Bin centers.
- $Y$  (*np.array*) – Average values of  $y$  in each bin.
- $S$  (*np.array*) – Standard deviation of  $y$  in each bin.
- $Sm$  (*np.array*) – Standard error of  $y$  in each bin.

`buckets.bin_data.bin_x(x, y, gx)`

Bins the input data  $x$  into centers at  $gx$  and calculates the mean of  $y$  in those bins.

#### Parameters

- $x$  (*array-like*) –  $x$  value to bin  $y$  value data by.
- $y$  (*array-like*) –  $y$  value to average over each  $x$  bin.
- $gx$  (*array-like*) – Bin centers over which to calculate averages of  $y$ .

**Returns**

- **bin\_means** (*np.array*) – Mean of y in each bin.
- **bin\_std** (*np.array*) – Standard deviation of y in each bin.
- **N** (*np.array*) – Number of elements in each bin.

`buckets.bin_data.standardarray(x)`

Make sure an array is a np.array object.

**Parameters** `x` (*array-like*) – Array-like object to turn into a numpy array.

**Returns** `x` – Converted array.

**Return type** `np.array`

### 2.1.3 Module contents

# CHAPTER 3

---

## buckets

---

Some better binning schemes for data visualization.

## Usage

To install, clone the library into a local repo, then run *pip install .* within the directory.

*bin\_n* allows for binning with an equal number of elements in each bin. To use:

```
``` from buckets import bin_n
```

```
X, Y, S, Sm = bin_n(x, y, n)
```

```
```
```
